## Chapter-08

## Introduction to Trigonometry

- Trigonometry is the branch of Mathematics which deals with the measurement of sides and angles of the triangles.
- In a right triangle ABC , right-angled at B ,
- $\quad \sin \mathrm{A}=\quad$ side opposite to angle $A, \cos A=$ side opposite to angle $A$ hypotenuse hypotenuse

$$
\begin{aligned}
& \mathrm{s} \tan A=\frac{\text { side opposite to ang }}{\text { side adjacent to angle } A} \\
& \operatorname{cosec} A=\frac{1}{\sin A} ; \sec A=\frac{1}{\cos A} \\
& \tan A=\frac{1}{\cot A}, \tan A=\frac{\sin A}{\cos A}
\end{aligned}
$$

- If one of the trigonometric ratios of an acute angle is known, the remaining trigonometric ratios of the angle can be easily determined.
- The values of trigonometric ratios for angles $0^{\circ}, 30^{\circ}, 45^{\circ}, 60^{\circ}$ and $90^{\circ}$.
- The value of $\sin A$ or $\cos A$ never exceeds 1, whereas the value of $\sec A$ or $\operatorname{cosec} A$ is always greater than or equal to 1 .
- $\sin \left(90^{\circ}-\mathrm{A}\right)=\cos \mathrm{A}, \cos \left(90^{\circ}-\mathrm{A}\right)=\sin \mathrm{A} ;$
- $\tan \left(90^{\circ}-\mathrm{A}\right)=\cot \mathrm{A}, \cot \left(90^{\circ}-\mathrm{A}\right)=\tan \mathrm{A}$;
- $\sec \left(90^{\circ}-A\right)=\operatorname{cosec} A, \operatorname{cosec}\left(90^{\circ}-A\right)=\sec A$.
- $\sin ^{2} \mathrm{~A}+\cos 2 \mathrm{~A}=1$,
- $\sec ^{2} \mathrm{~A}-\tan 2 \mathrm{~A}=1$ for $0^{\circ} \leq \mathrm{A}<90^{\circ}$,
- $\operatorname{cosec}^{2} \mathrm{~A}=1+\cot 2 \mathrm{~A}$ for $0^{\circ}<\mathrm{A} \leq 90^{\circ}$.
